Quality Control E-Admissions Information System About Us Welcome to College of Life Science, a world-class teaching, research and service university. Life Science university is an innovative multi-disciplinary university, with a student body of over 5,000. The university is housed in three campuses located in three districts in eastern Sri Lanka with facilities for teaching and research.1. Field of the Invention The present invention relates to a method and apparatus for manufacturing a magnetic recording medium and, more particularly, to a method and apparatus for manufacturing a high-density magnetic recording medium which has the ability to increase a coercive force (Hc) and a coercivity squareness (S^*). 2. Description of the Related Art A magnetic recording medium, i.e., a magnetic disc or a magnetic tape, has been developed to have a high density recording characteristic and high capacity storing characteristic. Such a magnetic recording medium has an inorganic non-magnetic substrate as a base and a magnetic layer formed on the base. The magnetic recording medium must have a high coercive force (Hc) and a high magnetic permeability in order to have a high density recording characteristic. The product having the magnetic recording medium is used for, for example, a magnetic recording/reproducing apparatus for information processing. For this reason, the product having the magnetic recording medium must be well-processed in addition to having a high recording characteristic. In order to obtain a magnetic recording medium having a high recording characteristic, a method for improving the film-forming process of the magnetic layer, a method for making the thickness of the magnetic layer thin, and a method for increasing the coercive force of the magnetic layer are known. The method for improving the film-forming process of the magnetic layer is a method in which a film-forming process for forming a magnetic film is changed to, for example, a sputtering process. The method for making the thickness of the magnetic layer thin is a method in which the thickness of the magnetic layer is made thin through selecting the kind of the magnetic powder. The method for increasing the coercive force (Hc) of the magnetic layer is a method in which the coercive force (Hc) of the magnetic layer is increased through using a material having a large coercive force (Hc) in the magnetic layer. For example, in order to improve the film-forming process of the magnetic layer, a method of manufacturing a magnetic recording medium is known which provides a magnetic layer composed
